Höhepunkte

1.With 3D-Flips "n" Roll, können Sie Ihren Flug mehr lustig machen.
2.Adopted 5.8G Daten transimmissiom System und integrierte in 2,31 Zoll-LCD-Bildschirm mit denen Sie die Live-HD-Blick von der FPV Kamera zu sehen und zu halten in Kenntnis gesetzt, was in der Luft geschieht.
3.2.4G Technologie angenommen für anti-interference.even mehr als eine quadcopter wird zugleich fliegen sie nicht miteinander interferieren.
4,6-Achsen-Gyrosensor Quad-Drehflügler Flug, starke Stabilität, lassen sich leicht verschiedene Flugbewegungen, stärkere Windwiderstand, leichter zu kontrollieren implementieren.
5.With LED-Licht, sicherer in den Nachthimmel geworden.

Technische Daten

Farbe schwarz
Frequenz: 2,4 GHz
Gyro: 6 Achsen-Gyro
Kamera-Pixel: 0.3MP
Ladezeit: Über 60 min
Flugzeit: Über 4-5mins
Steuerabstand: Über 20m
Copter Batterie: 3.7V 380mA Lipo Akku
Sender-Batterie: 3.7V 600mAh
Quadcopter Größe: 13,7 * 13,7 * 3.5cm
Paket-Größe: 37 * 12.2 * 33cm
Funktion: Auf- / unten, links / rechts, vorwärts / rückwärts, Nach links Flug / rechts Flug, Licht, Flips & amp; Brötchen, FPV Echtzeit
Typ: Quadcopter
Built-in Gyro: 6 Achsen-Gyro
Alter: ab 14 Jahre alt
Fernbedienung: 2,4 GHz Wireless-Fernbedienung
Kanal: 4-Channels

Paket Inhalt

1 x Quadcopter
1 x Transmitter
1 x Batterie
1 x USB-Ladegerät
1 x-Handbuch

FPV HD CAMERA

When camera meets drone, a walking movie is switched on. The flying drone takes the camera to capture the view that the camera never saw on the ground: the 5.8G real-time images transmission system offers you much more convenient aerial experience.

5.8G FPV HD REAL-TIME IMAGES TRANSMISSION

First-person view (FPV) is a great innovation of the high-tech world. It is a method used to control a radio-controlled vehicle from the driver or pilot's view point. Operator is able to enjoy the HD images from a first-person perspective via an onboard camera, which creates much more amazing real-flying experience.

3D FLIPS & ROLL

Pilot your aircraft up to 3 meters and you can choose normal roll mode or one-key roll mode to perform the roll action.

One-button roll mode: press the one-key roll button, your aircraft will roll forward.

Normal roll mode: Push the throttle control stick to the top, and then push the steering control stick to the top/bottom/left-most/right-most and return it to the middle position right away, your aircraft will roll as per your given signal.

(Tips: The second roll should wait 2 seconds after the first roll and the throttle should be pushed up to the top again.)

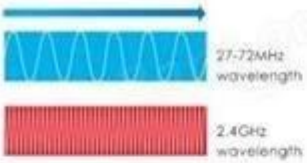
6-Axis GYRO

The latest 6-axis flight control system, permits super stable flight.

2.4GHz Radio control technology

The 2.4GHz radio technology has become the mainstream in radio control domain. Its transmission distance is up to 10 meters, this is a significant advantage over the 27MHz radio technology. Nowadays, low energy consumption and microminiaturization have become the active demand of the radio communication product; 2.4GHz radio technology satisfied this requirement very well.

The transmission speed of radio wave isabout300000 km/s.



Rapid response speed

2.4GHz is a special frequency range, it changed to the familiar frequency as we know,it equals to 2400MHz.Hence, it is also named as high frequency. Generally speaking, high frequency does not cause signal interference. The frequency range of 2.4GHz comes to fruition firstly in signal anti-interference. This year, signal interference occurs from time to time in the remote control playing gathering. Someone even doubt that high-voltage induction coil that caused by the spark of the car engine may bring signal interference.But, do not worry. The 2.4GHz does very well in this aspect. Signal interference will not occur even though multiple helicopters are played at the same time.

Powerful anti-interference capability

Take 72MHz for example, if using the Twentieth channel (72.190MHz), then, the transmitter use the exact 72.190MHz for transmitting signal only, and the receiver is also received the signal which is sending from 72.190MHz. In case that this channel is encounter obstacle, the radio communication will be presented. But the 2.4GHz system uses the high frequency range for sending signal, signal interference problem will not occur. Let' s take the FHSS frequency hopping pattern that Futaba 2.4GHz system adopts as an example. It takes the advantage of spread hopping way when sending signal. Imagined that there is a 16 lane highway and the 2.4GHz signal keeps moving from lane to lane, thus, the chance of signal interference is very small.
