Reflejos

1. con 3D voltea "n" roll, puede hacer que su vuelo sea más divertido.
2.Adopted 5.8G sistema de transimmissiom de datos y pantalla incorporada 2.31 pulgadas LCD que permite ver la imagen en directo de alta definición de la cámara FPV y mantenerse al tanto de lo que ocurre en el aire.
tecnología 3.2.4G adoptado para anti-interference.even más de un quadcopter está volando al mismo tiempo que no interfieran unos con otros.
4.6 ejes giroscopio de vuelo de cuatro helicópteros, fuerte estabilidad, se puede implementar fácilmente varios vuelos y de la resistencia del viento más fuerte, más fácil de controlar.
5.El con luz LED, ser más seguro en el cielo nocturno.

Presupuesto

De color negro
Frecuencia: 2,4 GHz
Gyro: 6 Axis Gyro
Pixel de la cámara: 0.3MP
Tiempo de carga: Alrededor de 60 minutos
Tiempo de vuelo: cerca 4-5mins
Control de Distancia: Sobre los 20m
Helicóptero de la batería: 3.7V 380mA Lipo
batería del transmisor: 3.7V 600mAh
Quadcopter Tamaño: 13.7 * 13.7 * 3.5cm
Tamaño del paquete: 37 * 12.2 * 33cm
Función: arriba / abajo, izquierda / derecha, adelante / atrás, vuelo hacia la izquierda / Hacia la derecha de vuelo, luz, chanclas & amp; rollos, FPV en tiempo real
Tipo: Quadcopter
El girocompás incorporado: 6 Axis Gyro
Edad: mayores de 14 años de edad
Control remoto: Control remoto inalámbrico de 2,4 GHz
Canal: 4 canales

Contenido del paquete

1 x quadcopter
1 x Transmisor
1 x batería
1 x cargador USB
1 x Manual de instrucciones

FPV HD CAMERA

When camera meets drone, a walking movie is switched on. The flying drone takes the camera to capture the view that the camera never saw on the ground: the 5.8G real-time images transmission system offers you much more convenient aerial experience.

5.8G FPV HD REAL-TIME IMAGES TRANSMISSION

First-person view (FPV) is a great innovation of the high-tech world. It is a method used to control a radio-controlled vehicle from the driver or pilot's view point. Operator is able to enjoy the HD images from a first-person perspective via an onboard camera, which creates much more amazing real-flying experience.

3D FLIPS & ROLL

Pilot your aircraft up to 3 meters and you can choose normal roll mode or one-key roll mode to perform the roll action.

One-button roll mode: press the one-key roll button, your aircraft will roll forward.

Normal roll mode: Push the throttle control stick to the top, and then push the steering control stick to the top/bottom/left-most/right-most and return it to the middle position right away, your aircraft will roll as per your given signal.

(Tips: The second roll should wait 2 seconds after the first roll and the throttle should be pushed up to the top again.)

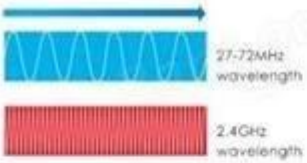
6-Axis GYRO

The latest 6-axis flight control system, permits super stable flight.

2.4GHz Radio control technology

The 2.4GHz radio technology has become the mainstream in radio control domain. Its transmission distance is up to 10 meters, this is a significant advantage over the 27MHz radio technology. Nowadays, low energy consumption and microminiaturization have become the active demand of the radio communication product; 2.4GHz radio technology satisfied this requirement very well.

The transmission speed of radio wave isabout300000 km/s.



Rapid response speed

2.4GHz is a special frequency range, it changed to the familiar frequency as we know,it equals to 2400MHz.Hence, it is also named as high frequency. Generally speaking, high frequency does not cause signal interference. The frequency range of 2.4GHz comes to fruition firstly in signal anti-interference. This year, signal interference occurs from time to time in the remote control playing gathering. Someone even doubt that high-voltage induction coil that caused by the spark of the car engine may bring signal interference.But, do not worry. The 2.4GHz does very well in this aspect. Signal interference will not occur even though multiple helicopters are played at the same time.

Powerful anti-interference capability

Take 72MHz for example, if using the Twentieth channel (72.190MHz), then, the transmitter use the exact 72.190MHz for transmitting signal only, and the receiver is also received the signal which is sending from 72.190MHz. In case that this channel is encounter obstacle, the radio communication will be presented. But the 2.4GHz system uses the high frequency range for sending signal, signal interference problem will not occur. Let' s take the FHSS frequency hopping pattern that Futaba 2.4GHz system adopts as an example. It takes the advantage of spread hopping way when sending signal. Imagined that there is a 16 lane highway and the 2.4GHz signal keeps moving from lane to lane, thus, the chance of signal interference is very small.
